## ***BROGAN***

**HIGH YIELD • STANDS STRONG • UNIFORM**

Brogan is a medium height, lodging resistant version of the tall SDSU HRSW variety Briggs. Brogan has the same general disease reaction as Briggs for foliar diseases tan spot and Septoria (moderately resistant), for leaf rust (moderately resistant), for stem rust (moderately resistant), and scab (moderately susceptible to susceptible). However, it is more susceptible to bacterial blight than Briggs, possibly due to its erect, uniform canopy. Brogan is 2 - 3 days later to head than Briggs but fills very rapidly. Protein and test weight are medium high like Briggs. Brogan is a free-threshing variety with good shatter resistance. Brogan is a great choice for farmers who like Briggs but don't like lodging.

### MANAGEMENT STRATEGY

1. Brogan is a medium-early maturity variety that responds to early planting but can be planted on any reasonable planting date.
2. Plant Brogan at normal populations for your area.
3. Fertilize Brogan for a yield of about 80 – 100 bu (2.5 lbs of N/bushel of yield to reach 14% protein). Make sure that Sulfur levels are in balance with Nitrogen; 5N:1S in the soil and 10N:1S in plant tissue is recommended.
4. An early (4-5 leaf stage) fungicide treatment is recommended for optimum yield.
5. Fungicide treatment at heading to control scab.
6. Harvest in a timely fashion to prevent secondary scab infestation.
